Abstracts

Hydrogen production iridium-based catalysts are materials containing iridium that accelerate the water electrolysis process to produce hydrogen. Iridium is highly effective for the oxygen evolution reaction (OER) in this process, crucial for efficient hydrogen production. These catalysts are particularly important in proton exchange membrane (PEM) electrolyzers due to their stability in acidic environments. However, iridium is rare and expensive, driving research into minimizing its use and finding alternative catalysts. The industry trend for hydrogen production iridium-based catalysts is focused on addressing the scarcity and high cost of iridium. Research efforts are heavily invested in developing catalysts with reduced iridium content, such as by creating novel structures or using supporting materials. There's also a strong push towards exploring alternative catalysts based on more abundant and cheaper materials. Despite these efforts, iridium-based catalysts remain crucial, especially for PEM electrolysis, which is gaining traction due to its high efficiency and ability to operate with renewable energy sources. Therefore, while reducing iridium usage is a key goal, improving the performance and durability of existing iridium-based catalysts is also a significant trend to enhance the economic viability of green hydrogen production.

The global Hydrogen Production Iridium Based Catalyst market size was estimated at USD 91.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
