Report Overview

A hydrogen refueling station chiller is a component of a hydrogen refueling station. The chiller operates by transferring heat from the compressed hydrogen to a coolant, which then carries the heat away from the dispensing unit and dissipates it through a heat exchanger. This cooling process is necessary because compressing hydrogen gas generates heat, and if the gas is not cooled sufficiently, it can cause safety issues such as increased pressure, which can lead to ruptures or explosions. Therefore, the chiller plays a critical role in ensuring the safe and efficient operation of a hydrogen refueling station.

The global Hydrogen Refueling Station Chiller market size was estimated at USD 2 million in 2023 and is projected to reach USD 84.59 million by 2032, exhibiting a CAGR of 51.60% during the forecast period.
