## Abstracts

The hydrological monitoring unmanned boat is an unmanned automated vessel used to monitor and collect hydrological data. It is usually powered by electricity or hybrid power and equipped with a variety of sensors and measuring equipment, such as water quality analyzers, current meters, sonar equipment, etc. It can operate autonomously or remotely to collect hydrological data such as water level, flow rate, temperature, oxygen content, turbidity, etc. in real time for environmental monitoring, scientific research, flood prevention and early warning, etc. Due to its automation, precision and efficiency, the hydrological monitoring unmanned boat provides a more flexible and reliable solution than traditional manual monitoring in the monitoring of complex waters such as rivers, lakes, reservoirs and oceans. Hydrological monitoring unmanned ships show great potential in water resources management and environmental monitoring. Compared with traditional manual monitoring methods, unmanned ships are automated, efficient and flexible. They can operate in complex waters and collect data continuously and accurately. This not only improves monitoring efficiency, but also reduces operational risks, especially in extreme environments such as floods and strong winds. Hydrological monitoring unmanned ships can provide real-time data, which is helpful for water quality analysis, flood prevention and early warning, and ecological protection, and provide stronger support for scientific research and environmental management. With the continuous advancement of technology, such unmanned ships will play a more important role in future hydrological monitoring.

The global Hydrological Monitoring Unmanned Boat market size was estimated at USD 921.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.40% during the forecast period.
