Abstracts

A hydrophilic emollient is a type of emollient that is primarily water-soluble or has an affinity for water. Unlike lipophilic emollients (which are oil-soluble), hydrophilic emollients are used in formulations to provide hydration, improve skin texture, and enhance the spreadability of water-based products. These emollients form a protective layer over the skin, helping to retain moisture and prevent dryness. They are typically found in lotions, creams, serums, and gels, where their primary function is to improve the water-binding properties of the product and provide a lighter, non-greasy feel compared to oil-based emollients.

The global Hydrophilic Emollient market size was estimated at USD 3261.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
