Abstracts

Hydrorefining catalysts are specialized chemical compounds, typically composed of metals like nickel, molybdenum, tungsten, or cobalt supported on alumina or silica-alumina substrates, designed to facilitate hydrotreating processes in petroleum refining and petrochemical production by removing impurities such as sulfur, nitrogen, oxygen, and metals from hydrocarbon feedstocks through reactions with hydrogen under high temperature and pressure, thereby improving fuel quality, meeting environmental regulations, and protecting downstream catalysts from poisoning. These catalysts are critical in producing cleaner transportation fuels and enabling the processing of heavier, lower-quality crude oils, with their performance and lifespan directly impacting refinery efficiency, operational costs, and compliance with stringent fuel standards worldwide.

The global Hydrorefining Catalyst market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
