Abstracts

Hydrostatic Release Units (HRUs) are critical safety devices used in marine and offshore environments to automatically deploy life-saving equipment, such as life rafts or emergency position-indicating radio beacons (EPIRBs), when a vessel sinks. These units function based on hydrostatic pressure: at a predetermined depth—typically around 1.5 to 4 meters underwater—the increasing water pressure activates a mechanism that releases a lanyard or pin, allowing the secured equipment to float free and become accessible for survival purposes. Designed to meet stringent international maritime safety standards, HRUs are mandatory on many commercial and recreational vessels to enhance emergency response and improve chances of rescue during maritime disasters.

The global Hydrostatic Release Unit market size was estimated at USD 78.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.75% during the forecast period.
