Report Overview

Hydrotreated Vegetable Oils (HVO) commonly referred to as renewable diesel and Hydroprocessed Esters and Fatty Acids (HEFA) are produced via hydroprocessing of oils and fats. Hydroprocessing is an alternative process to esterification to produce diesel from biomass. HVO/HEFA are straight chain paraffinic hydrocarbons that are free of aromatics, oxygen and sulfur and have high cetane numbers. HEFA offers a number of benefits over FAME (Fatty Acid Methyl Esters), such as reduced NOx emission, better storage stability, and better cold flow properties. Hence HEFA can typically be used in all diesel engines. Also, the use as an aviation (bio jet) fuel has been approved. HVO can be produced from a wide variety of materials containing triglycerides and fatty acids. Within this range of materials, HVO is flexible in its feedstock requirements allowing the use of a wide range of low quality waste and residue materials still leading to production of hydrocarbon drop-in products. The key additional feedstock needed is hydrogen which today comes from a fossil source.
