### Report Overview

Phosphorus is an important element for normal physiologic functions such as bone construction, nerve function, and muscle contraction. About 85% of phosphorus is stored in the bones and different tissues in the body. The excess phosphorus is eliminated from the body by the urinary system. The normal phosphate level in the blood is 3-4 mg/dL. Electrolytic disturbance resulting in high levels of phosphate in the blood causes hyperphosphatemia. Individuals with chronic kidney diseases have a decreased glomerular filtration rate and increased serum phosphate levels. The high phosphate levels in the serum lower calcium levels because of phosphate precipitation by calcium ions, leading to calcification of vascular tissues and heart diseases. Aluminum-, calcium-, magnesium-, and iron-based and aluminum-free, calcium-free phosphate binders are used to treat the condition.
