Report Overview

Airborne optoelectronic systems are developing rapidly and have a high degree of technical integration, and are widely used in national defense, air traffic, UAVs and other fields. The principle of scheduled action can be divided into information perception, information transmission and energy transmission. Multispectral imaging technology refers to dozens of frequency bands ranging from visible light to infrared, with spatial resolution ranging from several centimeters to several meters. It has the functions of target search, reconnaissance and surveillance, tracking and guidance, and is suitable for UAVs, helicopters, fixed-wing aircraft and other platforms. A hyperspectral camera, which responds to light reflected by a target rather than radiation emitted by the target, is based on a large focal plane array. It is the core equipment of UAV reconnaissance.
