Abstracts

Hysteroscopy is a simple procedure performed by doctors and gynecologists to investigate or look into the uterus of a woman with the help of a device called hysteroscope. Hysteroscopy is usually done to investigate and diagnose abnormal vaginal bleeding, such as heavy periods, bleeding after menopause, and heavy bleeding between periods. This procedure is also used if certain abnormalities of the uterus are detected during an ultrasound scan. These abnormalities include thickening of endometrium, polyps, and fibroids. This medical procedure enables doctors to see inside of the uterus (the endometrial cavity) and to plan an appropriate treatment under direct vision. A basic hysteroscope consists of a narrow long telescope with a light source and a camera attached to its distal end. The light source helps in illuminating the area which is to be visualized. The camera attached to the proximal end of the hysteroscope enables to project the image on a large video screen. According to our research, the global market for medical devices is estimated at US\$ 603 billion in the year 2023, and will be growing at a CAGR of 5% during next six years. The global healthcare spending contributes to occupy 10% of the global GDP and is continuously rising in recent years due to the increasing health needs of the aging population, the growing prevalence of chronic and infectious diseases and the expansion of emerging markets. The medical devices market plays a significant role in the healthcare industry. The market is driven by several factors, including the increasing demand for advanced healthcare services globally, advancements in medical technology, growing geriatric population, rising healthcare expenditure, and increasing awareness about early disease diagnosis and treatment.

The global Hysteroscopy System market size was estimated at USD 992.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
