### Report Overview

The I Line photoresist market is a specialized segment within the semiconductor photolithography industry, catering to the production of integrated circuits (ICs) and other microelectronic devices. I Line photoresists are chemically amplified resists designed to operate at the 365 nm wavelength (mercury I-line), making them suitable for mid-range lithography processes, particularly in applications where cost-effectiveness and process simplicity are prioritized over the extreme resolution offered by deep ultraviolet (DUV) or extreme ultraviolet (EUV) resists. These photoresists are widely used in the fabrication of memory chips, display panels, and certain logic devices, particularly in mature process nodes (e.g., 0.35  $\mu\text{m}$  to 0.13  $\mu\text{m}$ ). The market is driven by sustained demand from legacy semiconductor manufacturing, the growth of the Internet of Things (IoT), and applications in power devices and sensors, where advanced-node lithography is not essential. However, competition from KrF and ArF resists for higher-resolution applications, as well as the gradual phase-out of older fabrication lines, poses challenges. Geographically, Asia-Pacific dominates consumption due to high semiconductor production in Taiwan, South Korea, and China, while key suppliers include Tokyo Ohka Kogyo (TOK), JSR Corporation, and DuPont. Ongoing R&D focuses on improving sensitivity and etch resistance to extend the relevance of I Line resists in cost-sensitive applications.

This report offers a comprehensive and in-depth analysis of the global I Line Photoresist market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
