Abstracts

IC Physical Design and Verification is a key stage in the transition from logic circuit to physical implementation in the integrated circuit design process, mainly including chip layout and routing (Placement & Routing), clock tree synthesis, power consumption and area optimization, design rule checking (DRC), layout and circuit consistency verification (LVS) and other verification work. Its goal is to convert RTL-level design into a manufacturable GDSII file, ensure that the chip meets the manufacturing process specifications at the physical level, and has the expected performance, power consumption and reliability. It is an indispensable step to achieve "design sign-off" before chip tape-out.

The global IC Physical Verification and Design market size was estimated at USD 3255.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
