## Abstracts

The ice warning system is an intelligent system that integrates meteorological monitoring, data processing and early warning release functions. It collects meteorological data such as temperature, humidity, wind speed, etc. in real time through sensors deployed in key areas, and combines historical data and advanced algorithm models to predict and warn of possible ice and snow weather. The system is highly automated and intelligent, and can accurately identify the signs of ice and snow weather and quickly issue early warning information. The advantage of the ice and snow early warning system lies in its powerful data processing capabilities, which can extract valuable information from massive data and provide timely early warnings, thereby effectively guiding relevant units or individuals to take preventive measures to reduce the risks and losses caused by ice and snow weather. In addition, the system has high early warning accuracy and fast response speed, which provides strong support for responding to sudden severe weather and is an important part of the disaster prevention and mitigation system in modern society.

The global Ice Warning System market size was estimated at USD 601.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
