Abstracts

The ICI Type Pilling Tester is a laboratory instrument used to assess the pilling propensity of textile fabrics. It simulates the frictional wear that fabrics experience during everyday use. Specimens are mounted on polyurethane tubes and then tumbled within a cork-lined box at a controlled speed. This action causes the fibers to rub against each other, leading to the formation of pills. The degree of pilling is then visually assessed by comparing the tested samples with standard photographic references, providing a quantifiable measure of the fabric's resistance to pilling. The industry trend for ICI Type Pilling Testers is moving towards greater automation, precision, and integration with digital technologies. There's a growing demand for testers that can provide more objective and repeatable results, reducing the reliance on subjective visual assessments. This includes the incorporation of digital imaging and analysis systems that can automatically quantify pilling. Additionally, manufacturers are focusing on enhancing the testers' efficiency and versatility, with features such as adjustable speed and cycle settings to accommodate a wider range of fabric types and testing standards. The push for sustainability is also influencing the development of these testers, with a focus on energy efficiency and the use of durable, long-lasting components. Furthermore, the integration of IoT (Internet of Things) capabilities allows for remote monitoring, data logging, and seamless integration with laboratory information management systems (LIMS), streamlining testing workflows and improving data traceability. Finally, there is a push to create machines that can test more samples at one time, to increase lab efficiency.

The global ICI Type Pilling Tester market size was estimated at USD 261.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
