Abstracts

Immune checkpoint inhibitors (ICIs) for cerv cancer are a class of immunotherapy drugs designed to enhance the body's immune response against cancer cells. These drugs work by blocking specific proteins that cancer cells use to evade immune detection. In the case of cervical cancer, ICIs target checkpoint proteins like PD-1 (programmed cell death protein 1) or PD-L1 (programmed death-ligand 1). By inhibiting these interactions, ICIs help restore the immune system's ability to recognize and destroy cancer cells.
