Abstracts

The ICT probe is a precision tool designed for testing semiconductor and PCB performance. It can effectively evaluate the connectivity and electrical performance of each component on the circuit board by accurately contacting the test points on the PCB, thereby ensuring the high quality and reliability of the circuit board. As a standard means of detecting manufacturing defects and component failures, ICT testing focuses on checking the open and short circuit conditions of individual components online and various circuit networks. It is easy and fast to operate, and can quickly and accurately locate faults. It is an indispensable testing technology in the field of electronic manufacturing. At present, the main source of demand for ICT probes is the semiconductor market, which accounts for more than 40% of the market share. As the foundation of modern electronics industry, semiconductors' quality and performance directly determine the overall performance of electronic products. Therefore, in the semiconductor production process, ICT probes, as testing tools, are of significant importance in product quality testing.
