## Abstracts

IEP (Interferometric Endpoint Detection) and LEP (Laser/Light-based Endpoint Detection) are two types of optical endpoint detection systems used in semiconductor manufacturing?especially in plasma etching, ALD/ALE, thin-film deposition, and wafer-clean processes?to precisely determine when a process layer has been fully etched or deposited. These systems improve process accuracy, reduce over-etch/under-etch, increase wafer yield, and are essential in advanced nodes (7 nm / 5 nm / 3 nm / 2 nm).IEP (Interferometric Endpoint Detection) is a method that uses optical interference to measure changes in thin-film thickness during semiconductor etching or deposition. It works by shining a laser or broadband light onto the wafer surface, then analyzing the interference pattern (oscillations) created by reflections from different layers.LEP (Laser Endpoint Detection / Light-based Endpoint Detection) is an optical method that uses one or more laser wavelengths to measure changes in reflectivity or interference during etching or deposition. LEP is essentially a broader category that includes single-wavelength or multi-wavelength laser monitoring.

The global IEP and LEP Endpoint Detection System market size was estimated at USD 126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
