Inergen is a mixture of 52% Nitrogen, 40% Argon and 8% CO₂. However, in the event of a fire, when Inergen is discharged, it mixes with the air present in the room to create a mixture that comprises of 67.3% Nitrogen, 12.5% Oxygen, 17% Argon and 3.2% Carbon Dioxide. This discharge mixture makes Inergen singularly unique. No other inert gas has the unique ability to rapidly extinguish a fire yet at the same time provide a safe environment for any person within the occupied area by actually decreasing cardiac distress and maintaining arterial blood oxygenation and mental performance in low oxygen levels. Equally important, unlike some chemical gaseous fire suppression agents, Inergen does not, and could never create a reaction with a fire to create extremely harmful toxic or corrosive by-products. The IG-541 Clean Agent Extinguishing System is an efficient and environmentally friendly fire suppression technology widely used in specific locations such as computer rooms and telecommunication equipment rooms. It works by releasing a high-pressure mixture of gases into the affected area, rapidly reducing the oxygen concentration to suppress the combustion process and protect the equipment from damage. With the increasing global environmental awareness and emphasis on sustainable development, the IG-541 Clean Agent Extinguishing System has gained rapid prominence in the firefighting industry. Its non-lethal and non-polluting characteristics align well with strict environmental regulations and sustainable development goals, making it expected to continue to be favored in the market in the future.

The global IG-541 Clean Agent Extinguishing System market size was estimated at USD 198.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
