Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ignition Coil Core competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The ignition coil core is a critical component of the ignition coil in automotive ignition systems, typically made of high-permeability silicon steel laminations or soft magnetic alloys. Its primary function is to enhance magnetic flux density and energy conversion efficiency by storing magnetic energy during the energizing of the primary winding and rapidly releasing it when the circuit is interrupted. This process enables the secondary winding to generate high voltage, which ignites the air-fuel mixture in the engine cylinder. The performance of the ignition coil core directly affects engine combustion efficiency, power output, and emission levels. In 2024, the global production of ignition coil cores reached 297,900 tons, with an average price of 2,370 USD per ton.

The global Ignition Coil Core market size was estimated at USD 706.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
