### Report Overview

The ignition control module is a component that can regulate spark generation in many internal combustion engines. The main purpose of the ignition module is usually to open or close the grounding circuit of the primary winding inside the ignition coil. When this happens, the coil can generate enough voltage to ignite the spark plug. In order to ground the coil at the correct time, the ignition control module usually receives input from a sensor inside the distributor. The ignition module is usually located inside or near the distributor and is usually coated with an insulating compound to protect its internal electronic components.
