Report Overview

As CCD obsolescence becomes more prevalent in Healthcare and the dynamic imaging X-Ray market, the need to find alternatives is imminent. There are three flat panel detector technologies in the market, all vying to take CCD's place as the key market alternative. These are Amorphous Silicon (aSi), CMOS, and the newly emerging Indium gallium zinc oxide (IGZO).

At present, flat panel detectors using aSi and CMOS represent the biggest share of the market.

The third alternative on the market are the recent Indium gallium zinc oxide (IGZO) flat panel detectors. Like aSi they also use photodiodes but combine these with IGZO TFT's instead of aSi TFT's. IGZO TFT's can be made smaller than aSi TFT's and offer significantly improved switching performances. As a consequence, pixels become more sensitive (lower noise), can provide faster readout, and detector panel resolution can be further increased. IGZO panels are also just as available in cost effective and versatile options as the aSi panels with sizes ranging from 6" to 17" for medical applications. Unlike the aSi panels, they can acquire a usable image at equal or lower x-ray dose at faster acquisition speeds and with higher resolution. Performance wise, IGZO detectors are second best to CMOS detectors, but their expected price point – especially in larger detector formats – puts them in a promising position to replace the obsolete II-CCD RIU's.
