Abstracts

An illuminated tactile switch is an electromechanical component that combines a momentary push-button mechanism with an integrated light source, typically an LED, to provide both tactile feedback and visual indication of its operational status. These switches are designed to offer a distinct "click" feel upon actuation, confirming input registration, while the illumination serves functions such as power-on indication, mode signaling, or aesthetic enhancement in low-light environments. Constructed with materials like polycarbonate for the actuator and metal alloys for the contact mechanism, they often feature low operating forces, high lifecycle durability, and compatibility with surface-mount or through-hole PCB assembly. Common variants include single-color or RGB illumination, waterproof or sealed designs for harsh conditions, and options for varying actuation forces and travel distances to suit specific user interface requirements across industrial, consumer, and automotive applications.

The global Illuminated Tactile Switch market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
