Abstracts

Image-based fractional flow reserve (FFR) diagnosis refers to a non-invasive medical technology that uses computational fluid dynamics and machine learning algorithms applied to coronary computed tomography angiography (CCTA) images to estimate the functional significance of coronary artery stenosis, thereby providing a simulated FFR value without the need for invasive pressure wire measurement. This approach enables clinicians to assess whether a narrowed artery is causing restricted blood flow to the heart muscle, helping determine the necessity of interventions such as stenting or bypass surgery. By leveraging existing imaging data, it reduces procedural risks, shortens diagnosis time, and lowers healthcare costs compared to traditional invasive FFR, positioning it as an increasingly valuable tool in cardiovascular care for diagnosing ischemic heart disease.

The global Image Based Ffr Diagnosis market size was estimated at USD 125.67 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
