Abstracts

Image Guided Radiotherapy (IGRT) is a sophisticated radiation therapy technique that utilizes frequent imaging during the treatment process, typically through technologies such as cone-beam computed tomography (CBCT), ultrasound, or fiducial markers, to precisely target tumors while minimizing exposure to surrounding healthy tissues. This approach enhances the accuracy of radiation delivery by accounting for anatomical changes, organ motion, and patient positioning errors between and even during treatment sessions, thereby improving therapeutic outcomes and reducing side effects.

The global Image Guided Radiotherapy market size was estimated at USD 2800.55 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
