## Abstracts

Image reversal resist is a photolithography material that achieves positive and negative conversion of patterns through specific exposure and development processes during the photolithography process. Its characteristic is that it can form a protective layer in the exposed area, while the unexposed area can be dissolved by the developer, thereby achieving fine and precise pattern transfer. The advantages of this photoresist are its high resolution, good aspect ratio and excellent corrosion resistance, which makes it perform well in submicron and even nanometer-level photolithography processes and meet the needs of high-precision manufacturing.

The global Image Reversal Resist market size was estimated at USD 153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
