Report Overview:

Imaging radar is a subset of radar. Its name comes from its high angular resolution, which can provide clear images. Angular resolution is the ability to distinguish objects within the same range of distance and relative velocity, and recognize static objects at high resolution. Imaging radar is considered to be a comprehensive cost performance advantage that will have more cost and performance than other sensors. In some cases, imaging radar may identify objects on the road, such as bicycles, people or small obstacles. At the same time, it has the traditional advantages of dealing with bad weather conditions, which, at least so far, camera, ultrasonic and lidar can't do.

The Global Imaging Radar Market Size was estimated at USD 1089.91 million in 2023 and is projected to reach USD 1572.50 million by 2029, exhibiting a CAGR of 6.30% during the forecast period.
