### Report Overview

Imazethapyr is an organic heterocyclic herbicide, belonging to the imidazolinone compound, also known as pusaite, imidazoethylnicotinic acid, benzathazole, pusaite, and imazethapyr. Its isopropylamine salt is suitable for the control of all weeds. It has excellent herbicidal activity against sedge weeds, annual and perennial monocotyledonous weeds, broad-leaved weeds and miscellaneous woods. It can be used before or after budding, can be quickly absorbed by plant roots and leaves, inhibit the biosynthesis of plant side chain amino acids, destroy proteins, inhibit the growth of weeds, and promote their death. After foliar treatment, sensitive weeds stop growing immediately and generally die after 2 to 4 weeks. Selectivity is due to the different metabolic rates of plants, and the metabolic rate of resistant plants is faster than that of sensitive plants. After leguminous plants absorb imazethapyr, they are quickly metabolized and decomposed in the body, which is safe for soybeans. The half-life of imazethapyr in soybeans is about 1.6 days. This report counts the imazethapyr original drug (the content is mostly 98%, and some companies have 96% products).
