Abstracts

Imidocarb dipropionate is a chemotherapeutic agent primarily used in veterinary medicine as an antiprotozoal drug, specifically effective against blood parasites such as *Babesia* and *Anaplasma* species that cause diseases like babesiosis and anaplasmosis in livestock (e.g., cattle, sheep) and companion animals (e.g., dogs). It functions by inhibiting protozoal DNA synthesis and replication, administered via subcutaneous or intramuscular injection, and is valued for its prolonged action, which allows for extended therapeutic coverage with fewer doses. Its use is regulated in many countries due to residue concerns in food-producing animals, requiring adherence to withdrawal periods to ensure meat and milk safety.

The global Imidocarb Dipropionate market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
