Abstracts

Immersion Cooling Green Data Centers use dielectric fluids to completely immerse servers and IT hardware, enabling direct-contact heat dissipation with ultra-high cooling efficiency. This technology significantly reduces energy consumption, lowers PUE values, supports high-density computing, and improves sustainability for AI clusters, cloud computing, and edge data centers. The industrial chain of Immersion Cooling Green Data Centers builds a complete ecosystem around the efficient heat dissipation needs of high-density computing power. The upstream is supported by core components such as fluorinated coolants, microchannel cold plates, and cooling distribution units (CDUs), with domestic substitution accelerating steadily. The midstream integrates hardware and heat dissipation algorithms through system integrators to create customized solutions for AI servers and supercomputing centers, enabling green operation with a PUE as low as 1.15. The downstream serves a wide range of fields including the Internet, cloud computing, and intelligent computing, becoming a core solution for high-power chip heat dissipation. Driven by the explosion of computing power demand and dual-carbon policies, the global market size of this industry will reach 100 billion level by 2025. Chinese enterprises have prominent advantages in core components and scenario adaptation, leading the industry's technological iteration and cost optimization. The gross profit margin of major companies in the industry is between 48% ? 68%.

The global Immersion Cooling Green Data Center market size was estimated at USD 3920.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.30% during the forecast period.
