Abstracts

Immersion liquid cooling is a thermal management technology that involves submerging electronic components, such as servers or high-performance computing hardware, directly into a non-conductive dielectric fluid to dissipate heat more efficiently than traditional air or water cooling methods. This approach eliminates the need for fans, reduces energy consumption, and enables higher computing density by leveraging the superior heat transfer properties of specialized engineered fluids, making it particularly suitable for data centers, cryptocurrency mining operations, and other high-heat-generating environments where thermal efficiency and noise reduction are critical.

The global Immersion Liquid Coolers market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
