## Abstracts

Immersive audio solutions refer to a set of technologies, systems, and products that can create a three - dimensional, enveloping audio environment, enabling listeners to feel as if they are in the sound scene, with a strong sense of presence and immersion.

**Technical Principles - Sound Source Localization Technology:** By precisely controlling the playback time, volume, and phase of sound, it enables listeners to perceive the specific position of the sound source in space, such as front - rear, left - right, and up - down. Technologies like Dolby Atmos and DTS: X are representative, which can define the position of sound in a three - dimensional space, allowing sound to move freely in the air, breaking through the limitation of traditional two - channel stereo. - **Head - Related Transfer Function (HRTF) Technology:** This technology simulates the influence of the human head, ears, and torso on sound. Different HRTF parameters are set according to the individual's physiological characteristics, so that when wearing headphones, the sound can be accurately positioned in different directions around the head, presenting a personalized 3D audio effect.

The global Immersive Audio Solutions market size was estimated at USD 5346.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
