Report Overview

Immune Adjuvant is a substance or compound that is used in conjunction with a vaccine to enhance the body's immune response to the antigens present in the vaccine. It serves as a potentiator, stimulating the immune system to produce a more robust and prolonged response to the vaccine components. Adjuvants can be derived from various sources, including natural materials, synthetic compounds, or biodegradable polymers. They work by increasing the antigen's visibility to the immune system, prolonging its presence at the injection site, and promoting the activation of immune cells. The use of immune adjuvants is crucial in vaccine development, as they can reduce the amount of antigen needed, decrease the number of doses required, and improve the overall effectiveness of the vaccine, particularly for diseases where the immune response to the pathogen is weak or insufficient.
