Abstracts

Immune checkpoint agents are a class of immunotherapeutic drugs designed to modulate the body's immune response by targeting specific regulatory pathways, primarily inhibitory receptors such as PD-1, PD-L1, and CTLA-4, which are exploited by cancer cells to evade immune surveillance. These agents function by blocking these inhibitory signals, thereby "releasing the brakes" on T-cells and enabling a more robust anti-tumor immune response. They are predominantly used in oncology for the treatment of various malignancies, including melanoma, non-small cell lung cancer, and renal cell carcinoma, and have revolutionized cancer care by offering durable responses in a subset of patients, though their efficacy and safety profiles can vary significantly across cancer types and individual patients.

The global Immune Checkpoint Agents market size was estimated at USD 42368.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.60% during the forecast period.
