Abstracts

Immuno-oncology treatment refers to a class of cancer therapies that harness and enhance the body's own immune system to recognize, target, and destroy cancer cells, primarily through mechanisms such as immune checkpoint inhibitors, adoptive cell transfer (including CAR-T cell therapy), cancer vaccines, and cytokine therapies. These treatments differ fundamentally from traditional approaches like chemotherapy and radiation by focusing on modulating immune responses rather than directly attacking tumors, offering the potential for durable, long-term remissions and improved outcomes in various malignancies, particularly those that are advanced, metastatic, or resistant to conventional treatments.

The global Immuno Oncology Treatment market size was estimated at USD 106450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 14.50% during the forecast period.
