Abstracts

Immunoabsorbent columns are specialized medical devices used in therapeutic apheresis procedures, primarily for the selective removal of specific pathogenic substances such as autoantibodies, immune complexes, or inflammatory mediators from a patient's blood or plasma. These columns contain immobilized ligands, such as protein A or specific antigens, that bind target molecules with high affinity, enabling extracorporeal purification while minimizing the loss of beneficial blood components. They are predominantly employed in the treatment of autoimmune disorders, neurological conditions like myasthenia gravis, and certain types of nephrological and rheumatological diseases, offering a targeted therapeutic alternative to systemic immunosuppression.

The global Immunoabsorbent Column market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
