Report Overview

Immunohistochemistry (IHC) is a technique used in the field of pathology to detect the presence, abundance, and localization of specific proteins within tissue samples. It involves the use of antibodies that bind to specific antigens in the tissue, which are then visualized using a chromogenic or fluorescent detection system. This technique is widely used in research, clinical diagnostics, and drug development to study various diseases such as cancer, infectious diseases, and autoimmune disorders.

Immunohistochemistry plays a crucial role in understanding the molecular mechanisms underlying diseases and in guiding treatment decisions based on the expression of specific biomarkers in patient samples.

The market for Immunohistochemistry is experiencing steady growth due to several market drivers. One of the key drivers is the increasing prevalence of cancer and other chronic diseases, which has led to a growing demand for diagnostic techniques that can provide detailed information about disease pathology. Additionally, advancements in technology have made immunohistochemistry more sensitive, specific, and automated, making it easier to perform and interpret results. Moreover, the rising investment in research and development activities in the pharmaceutical and biotechnology industries is driving the demand for immunohistochemistry products and services for drug discovery and development purposes. At the same time, the growing focus on personalized medicine and targeted therapies is further fueling the adoption of immunohistochemistry for biomarker analysis and patient stratification.
