Abstracts

Immunomagnetic beads (IMBs) are functionalized magnetic particles, typically composed of a superparamagnetic core?such as iron oxide?coated with a polymer or silica shell, and conjugated with specific ligands (e.g., antibodies, streptavidin, or protein A/G) designed to selectively bind target proteins from complex biological samples through affinity interactions; these beads enable efficient protein isolation, purification, and detection under magnetic fields, leveraging their high surface-area-to-volume ratio, minimal nonspecific binding, and compatibility with automated high-throughput systems, making them indispensable tools in proteomics, diagnostics, biopharmaceutical production, and biomedical research for applications like immunoprecipitation, pull-down assays, cell separation, and targeted protein extraction.

The global Immunomagnetic Beads Protein market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
