Report Overview:

Immunoturbidimetry is a dynamic assay method for antigen-antibody binding. The basic principle is: when the antigen and antibody react in a special dilution system and the ratio is appropriate, they will precipitate from the liquid phase to form particles, which will make the reaction liquid appear turbid. When the antibody concentration is fixed, the amount of the formed immune complex increases with the increase in the amount of antigen in the test sample, and the turbidity of the reaction solution also increases. By measuring the turbidity of the reaction solution and comparing it with a series of standard substances, the content of the antigen in the test sample can be calculated.

The Global Immunoturbidimetry Reagents Market Size was estimated at USD 4740.93 million in 2023 and is projected to reach USD 7523.27 million by 2029, exhibiting a CAGR of 8.00% during the forecast period.
