Report Overview

Impedance-based TEER (Trans Epithelial/Endothelial Electrical Resistance) Measurement System refers to a specialized apparatus designed for assessing the integrity of cell barriers in cell culture models, particularly epithelial or endothelial cell monolayers. This system utilizes impedance measurements, typically electrical resistance, to evaluate the tightness and functionality of these cell barriers. By passing a low-frequency alternating current through the cell layer, the system measures the resistance encountered, providing valuable insights into the barrier properties of the cells. This technology is widely used in various research fields, including pharmacology, toxicology, and tissue engineering, to study cellular responses, drug permeability, and the overall physiological conditions of cell barriers. Impedance-based TEER measurement systems contribute to advancing our understanding of cellular interactions and play a crucial role in drug development and disease modeling.
