## Abstracts

Impermeable carbon graphite is a specialized engineering material produced by impregnating porous graphite with synthetic resins, metals, or other substances to eliminate permeability, thereby enhancing its mechanical strength, thermal conductivity, and corrosion resistance while maintaining graphite's inherent self-lubricating properties and stability at high temperatures. This material is engineered to perform in demanding environments where standard graphite would fail due to porosity, making it suitable for applications requiring hermetic sealing, resistance to aggressive chemicals, or operation under extreme pressure and temperature conditions. Its impermeability is achieved through a controlled impregnation process that fills the natural micro-pores within the graphite matrix, resulting in a dense, non-porous structure that prevents fluid or gas penetration, which is critical in industries such as chemical processing, aerospace, energy, and precision manufacturing.

The global Impermeable Carbon Graphite market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
