Abstracts

Implant eyelid weights are small, biocompatible devices surgically placed in the upper eyelid to assist with eyelid closure in patients suffering from lagophthalmos, a condition often resulting from facial nerve paralysis (such as in Bell's palsy or stroke) where the eyelid cannot fully close, leading to corneal exposure, dryness, and potential vision damage. These implants, typically made of materials like gold or platinum due to their density and biocompatibility, function by adding gravitational force to aid natural eyelid mechanics, thereby protecting the ocular surface and improving patient comfort and visual outcomes.

The global Implant Eyelid Weights market size was estimated at USD 25.8 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
