Abstracts

Impressed current anodes are critical components in cathodic protection systems, designed to prevent corrosion of metallic structures submerged in electrolytes such as soil or water by providing a controlled electrical current. These anodes, typically made from durable, conductive materials like mixed metal oxide (MMO), platinum-coated niobium, or silicon-iron, are connected to an external power source (a rectifier) that supplies a continuous impressed current, enabling long-term protection for large-scale infrastructure such as pipelines, ship hulls, storage tanks, and offshore platforms. Unlike sacrificial anodes, which corrode over time, impressed current anodes are engineered for extended service life and higher current output, allowing for adjustable protection levels and suitability for environments with high resistivity or aggressive chemical conditions. The technology is essential in industries prioritizing asset integrity, safety, and regulatory compliance, including oil and gas, water treatment, maritime, and civil engineering.

The global Impressed Current Anode market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
