Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Impressed Current Cathodic Protection (ICCP) Systems competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Impressed Current Cathodic Protection (ICCP) Systems are active electrochemical corrosion prevention method that uses an external direct current (DC) power source to apply current to a metal structure, thereby reducing its electrochemical potential and making it the cathode of an electrochemical cell. This controlled current flow suppresses the natural corrosion process of the protected structure. The system typically consists of a DC power supply (rectifier), auxiliary anodes, control units, and connecting cables. ICCP systems are widely used to protect underground pipelines, submerged steel structures, ship hulls, storage tank bottoms, and reinforced concrete elements from corrosion. Unlike sacrificial anode systems, ICCP offers greater control over current output, broader protection range, and precise potential regulation, making it ideal for environments with high corrosion risk or where long-term protection and monitoring are required. This technology plays a vital role in the oil & gas, marine, power, infrastructure, and water industries, helping to extend the service life of critical assets, reduce maintenance costs, and enhance structural safety. Impressed Current Cathodic Protection (ICCP) System market is witnessing steady growth, driven by increasing global concerns over asset integrity, corrosion-related losses, and the need for extended infrastructure lifespan. Industries such as oil & gas, marine engineering, power transmission, water utilities, and transportation are investing more heavily in advanced corrosion prevention technologies to protect buried pipelines, offshore structures, storage tanks, and reinforced concrete systems. ICCP systems, known for their high current capacity, precise potential control, and long

service life, are gradually replacing traditional sacrificial anode methods in high-risk and high-value applications. The integration of remote monitoring, automatic potential adjustment, and IoT-based corrosion diagnostics is further enhancing the effectiveness and manageability of ICCP solutions.

The global Impressed Current Cathodic Protection (ICCP) Systems market size was estimated at USD 613.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
