The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on IMR (Index of Microcirculatory Resistance) Measurement competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. IMR (Index of Microcirculatory Resistance) is a pressure and temperature wire-based invasive diagnostic index used to quantify the resistance of the coronary microcirculation during maximal hyperemia. It is calculated by multiplying the distal coronary pressure (Pd) by the mean transit time (MTT) of a saline bolus during hyperemia ($IMR = Pd \times MTT$). IMR provides a specific, reproducible assessment of microvascular function and is particularly useful in identifying microvascular angina or assessing patients with INOCA (Ischemia with No Obstructive Coronary Arteries). It is not influenced by epicardial coronary artery stenosis and offers valuable insights into coronary microvascular health.

The global IMR (Index of Microcirculatory Resistance) Measurement market size was estimated at USD 51.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.70% during the forecast period.
