Abstracts

In-cabin 3D Time-of-Flight (ToF) sensors are advanced optical sensing devices that use infrared light pulses to measure the distance between the sensor and objects within a vehicle's interior, generating high-resolution depth maps and 3D point clouds in real time. These sensors are engineered to operate under varying lighting conditions and capture spatial data with high accuracy, enabling applications such as occupancy detection, driver monitoring, gesture recognition, child presence detection, and adaptive safety system activation. Unlike 2D cameras or simpler sensors, ToF technology provides detailed volumetric information without relying on ambient light, making it particularly suitable for automotive environments where reliability, privacy, and performance are critical.

The global In Cabin 3D ToF Sensor market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
