## Abstracts

In-car camera lenses for Advanced Driver Assistance Systems (ADAS) are specialized optical components designed to capture high-resolution, wide-angle, and often multi-spectral (e.g., RGB, infrared) imagery in real-time to support functions such as lane departure warnings, adaptive cruise control, automatic emergency braking, blind-spot detection, and traffic sign recognition. These lenses must meet stringent automotive-grade standards for durability, temperature resistance, and optical performance to ensure reliability under diverse driving conditions, including low light, glare, and inclement weather. They are integral to the sensor suite of modern vehicles, enabling machine vision algorithms to interpret the environment accurately. As ADAS capabilities evolve toward higher levels of automation, these lenses are increasingly required to support higher resolutions, wider fields of view, and advanced features like polarization filtering to reduce artifacts and enhance object detection.
