Abstracts

In Mold Decoration (IMD) foil is a specialized film technology used to integrate high-resolution graphics, textures, and functional coatings directly into molded plastic parts during the manufacturing process, combining decorative elements?such as colors, patterns, metallic effects, or even touch-sensitive surfaces?with structural components in a single, efficient step. This technique involves applying a multi-layered foil, often composed of a carrier film, release layer, decorative or functional coating, and adhesive, which is placed into a mold before injection; as molten plastic is injected, it bonds permanently with the foil, resulting in a seamless, durable, and aesthetically enhanced product that resists wear, chemicals, and fading, making it ideal for applications in automotive interiors, consumer electronics, home appliances, and medical devices where both visual appeal and functionality are critical.

The global In Mold Decoration Foil market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
