## Abstracts

Spacecraft on-orbit servicing refers to the process in which the equipment and devices carried by the service spacecraft interact with the target spacecraft to achieve the purpose of the service. Spacecraft on-orbit servicing involves a number of key technologies, including high-precision navigation and guidance technology, docking and locking technology, fuel transfer and management technology, etc. The implementation of these technologies faces many challenges, such as the complexity of the space environment, the diversity of target spacecraft, and the requirements for docking accuracy. In addition, the spacecraft providing on-orbit services requires powerful observation, identification, power, energy, control capabilities, and sophisticated operating methods. China has made rapid progress in this field, mastering several core technologies. For example, the Tianzhou series cargo spacecraft successfully achieved a rapid rendezvous and docking within three hours, marking the efficiency and maturity of China's on-orbit resupply capabilities. Simultaneously, to support long-term operation, the Chinese space station has established a "scientific experiment mirror platform," using a 1:1 ground model to efficiently verify on-orbit experimental plans, providing strong support for the synergy between on-orbit services and scientific experiments. The global on-orbit service market is showing enormous potential, attracting many commercial space companies. According to an industry research report, in addition to traditional space giants, emerging companies such as D-Orbit, Astroscale, and Orbit Fab are also very active. Currently, the scope of services has expanded from traditional on-orbit transportation (space express) and on-orbit assembly to more areas such as on-orbit manufacturing. In the future, on-orbit service technology will develop towards greater autonomy and wider applications. With advancements in artificial intelligence and robotics, space robots will be able to independently complete more complex tasks. Meanwhile, on-orbit assembly of large space infrastructure (such as very large telescopes) and "space debris cleanup" will become important application areas,

helping to maintain the sustainability of the space environment.

The global In-Orbit Servicing market size was estimated at USD 7694.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 22.90% during the forecast period.
