Report Overview

An in-place inclinometer, also known as an inclinometer casing or inclinometer probe, is a device used to measure the inclination or slope of the ground or structures. It consists of a casing or probe that is installed in a borehole or directly embedded in the ground or structure. Inside the casing, there is an inclinometer sensor that can detect changes in tilt or inclination at multiple depth intervals. The in-place inclinometer measures the angle of the casing or probe at various depths, providing data on the slope profile or lateral displacement of the monitored area. This data is typically collected using a probe retrieval system, which allows for periodic measurements. In-place inclinometers are commonly used in geotechnical engineering, landslide monitoring, slope stability analysis, and structural monitoring.
