Abstracts

The in-situ electron microscope measurement system is a high-precision device that combines electron microscope technology with real-time sample monitoring functions. It is used to capture the physical and chemical changes of samples in real time during microscopic observation or experiments. Through in-situ electron microscopy, researchers can directly observe the changes of samples in natural environments or under specific conditions (such as high temperature, humidity, electric field, magnetic field, etc.) under scanning electron microscopes (SEM) or transmission electron microscopes (TEM). It is used in the fields of materials science, biology, nanotechnology, etc. to analyze the behavior of materials during actual use or under experimental conditions, providing higher dynamic and spatial resolution than traditional electron microscopes.

The global In-Situ Electron Microscope Measurement System market size was estimated at USD 393.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.60% during the forecast period.
